"Wellness is a lifelong process of assuming personal responsibility that empowers the individual to exercise choice, make informed decisions and take action towards a more balanced, dynamically sustainable and fulfilling existence in all dimensions of life"

NEUROLOGY—Assessment of the Elderly with Dr Paul Noone

Studies have revealed that more and more older members of our community are utilising chiropractic services. Older patients continually report favourable responses to chiropractic care with many opting for ongoing maintenance care.

So what are the special consideration we need to make when examining and treating our older patients?

Chiropractic treatment, in recent years, has increasingly been demonstrated to have a measurable, positive impact on the human nervous system, including higher brain function. Chiropractic treatment of the aging nervous system requires a thoughtful clinical management strategy.

The numbers of older patients in chiropractic clinics is increasing , presenting with issues related to balance and dizziness. The history and examinations of such patients are very often complex and present difficulties in developing a working hypotheses for care. The increasing volumes of information regarding care of the older patients can also serve to further complicate the development of an accurate diagnosis of the patients presenting complaint.

Dr Noone will explore the nervous system and explain the impact of age on neurological function. He will demonstrate why chiropractic care is an appropriate fit in the health management plans of our older community members. He will identify pointers in the history and examination of an older patient, and provide practical tips in the treatment and rehabilitation of older patients. He will also report on the results of a recent ASRF funded study examining the Falls Risks Profile of Chiropractic patients over 65.

Venue: Royal Adelaide Hospital - Oncology Department *(directions are located on the back)*
